True

False

True

False

True

D. Answer the following questions.

1. What is malware? What does it do?

Ans: Malware is malicious software. It is a program that is developed for the purpose of harming the computer system. Thus, malware includes computer viruses, worms, Trojan horses and spyware.

2. Compare virus and worm.

Ans: **VIRUS**

The full form of VIRUS is Vital Information Resources Under Seize. A **computer virus** is a program that replicates itself. It may be attached to other programs or it may create copies of itself. It may change or damage data or degrade the performance of your machine by utilising resources such as memory or disk space. It can also hack your computer system and share the information stored within your system with the hacker's systems.

WORMS

Worms infect and multiply without targeting and infecting specific files already present on the computer. They may show up via email, network or instant message software and then create more emails or messages to spread to. They often do not cause much damage such as deleting files on the computer. However, there are many kinds of worms that attempt to disable firewalls, antivirus software and other security elements.

3. Define payload. Give three payloads of virus infection.

Ans: The action which a virus performs on the computer is called **payload**. The three payloads of a virus are:

- Deletes files
- Formats the hard disk
- Degrades performance

4. List advantages of antivirus software.

Ans:

An antivirus software detects, prevents and removes malware from your computer.

5. What precautions should be taken to protect a computer from malware?

Ans:

The precautions that one should take to protect their computer from malware are:

- Install antivirus software.
- Always backup your files.
- Even though email services have virus scanners, run a thorough scan on any attachment you get.
